Summary

▶ **TABLE OF CONTENT**

About Project

This project aims to help students or professionals to learn the main concepts of Docker

(back to top)

Getting Started

Light

This is an example of how you may give instructions on setting up your project locally. To g
local copy up and running follow these simple example steps.

Prerequisites

This is an example of how to list things you need to use the software and how to install them.

- git
- Virtual Box and extension
- Vagrant

Installation

Clone the repo

```
git clone https://github.com/marcossilvestrini/learning-docker.git
```

Usage

Use this repository for get learning about Docker exam

(back to top)

Roadmap

- [x] Create repository
- [x] Create github action for automation tasks
- [x] Create examples about docker containers
- [x] Create examples about docker images

(back to roadmap)

(back to top)

Docker Engine work with namespaces(PID,NET,IPC,MNT,UTS) and cgroups.

```
# Get a version of docker
docker --version
```

Docker Containers

```
# list containers
docker container ls
docker ps

# list containers id
docker container ls -aq
docker ps -aq

# list containers virtual size
docker container ls -s

# create containers
docker container create -it ubuntu

# run container
docker run hello-world

# run container iterative
docker run -it <image_name> bash

# execute command in container
docker exec -it <container_id_or_name> <command>

# connect to docker container
docker container attach <CONTAINER ID>

# run container with name
docker run -it --name ubuntu01 ubuntu bash

# create container with specified network
docker run -it --name ubuntu01 --network skynet ubuntu bash

# create container with network host
docker run -it --name ubuntu01 --network host ubuntu bash

# start containers
docker container start ubuntu

# stop pause containers
docker stop <container_id_or_name>
docker stop -t=0 <container_id_or_name>

# Stop all containers
docker stop $(docker container ls -q)

# Pause\Unpause containers
docker pause <container_id_or_name>
docker unpause <container_id_or_name>

# delete container
docker rm <container_id_or_name> --force

# delete all containers
docker container rm $(docker container ls -aq) --force
```

```
# forwarding port
docker run -d -P <container_id_or_name>
docker run -d -p 8080:80 <container_id_or_name>

# show map ports
docker port <container_id_or_name>

# inspect container
docker inspect <container_id_or_name>

# show container resources usage information
docker container stat
docker container stats <container_id_or_name>

# show process in execution in container
docker container top <container_id_or_name>

# show container logs
docker container logs <container_id_or_name>
docker container logs -f <container_id_or_name>

# set limit of memory for container
docker container run -it -m 512M --name testmemory debian
docker container run -it --name testmemory2 --memory 1G debian

# set limit of cpu for container
docker container run -it --cpus=0.5 --name testcpu nginx

# update ram|cpu resource in container
docker container update -m 2048 testmemory
docker container update --cpus=3 testcpu

# get infos memory and cpu
docker inspect <container_id_or_name> | grep -i cpu
docker inspect <container_id_or_name> | grep -i mem
```

(back to docker containers)

(back to top)

Docker Images

```
# pull image
docker pull <image_name>

# show local images images
docker images

# show details of images
docker inspect <image_id>
```

```
# show  details of images layers
docker history <image_id>

# remove docker images
docker rmi <image_id> --force

# remove all docker images
docker rmi $(docker images -aq) --force
```

Docker Build

Build a docker image

```
# first, create your Dockerfile with your app

# Example Dockerfile
FROM debian
RUN /bin/echo "HELLO DOCKER"

# then create a docker image.
cd <path_of_your_dockerfile>
docker build -t <dockerhub_username/image_name:tag>

# publish your image in docker hub
docker push <dockerhub_username/image_name:tag>
```

(back to docker images)

(back to top)

Docker Volumes

```
# list docker volumes
docker volume ls

# inspect docker volumes
docker volume inspect <volume_name>

# create docker volume
docker volume create <volume_name>

# delete docker volume
docker volume rm <volume_name>

# create container with docker bind mounts
docker run -it -d -v <path_local_for_data>:<path_container_for_data> <image_name_or_
```

```
docker run -d --mount type=bind,source=/myfolder-volume,target=/app <image_na
docker run -d -v <volume_name>:/app <image_name_or_id>

# mount file
docker container run -ti --mount type=bind,src=<path_local_for_data/file>,dst=<path_
```

(back to docker volumes)

(back to top)

Docker Network

```
# list networks
docker network list

# inspect docker network
docker network inspect <network_name>

# create docker network bridge
docker network create --drive bridge <network_name>

# delete docker network
docker network rm <network_name>
```

(back to docker network)

(back to top)

Docker Compose

```
# list containers|services
docker-compose ps
docker-compose -f configs/docker/apps/app-silvestrini/docker-compose.yaml  ps

# create containers|services
docker-compose up
docker-compose up -d
docker-compose -f configs/docker/apps/app-silvestrini/docker-compose.yaml up
```

(back to docker composed)

(back to top)

Contributing

Light

Contributions are what make the open source community such an amazing place to learn, inspire, and create. Any contributions you make are **greatly appreciated**.

If you have a suggestion that would make this better, please fork the repo and create a pull request. You can also simply open an issue with the tag "enhancement". Don't forget to give the project a star! Thanks again!

1. Fork the Project
2. Create your Feature Branch (`git checkout -b feature/AmazingFeature`)
3. Commit your Changes (`git commit -m 'Add some AmazingFeature'`)
4. Push to the Branch (`git push origin feature/AmazingFeature`)
5. Open a Pull Request
